3

4 **Recap**

- We are discussing the "requirement gathering, analysis & specification" stage
  - Learned about the usability requirement gathering and functional specifications
- Today – case study on usability requirement gathering

5 **Example Scenario**

- A calendar app
  - We are interested to build a calendar app. It is meant for the students (mainly) to help in their various academic activities
  - Let's try to find out the requirements to build this app (and also specify those)

6 **Usability Requirements**

7 **Case Study – Calendar App (Usability Requirement)**

- To get that, we can perform contextual inquiry (CI)

8 **CI Recap - Five Stages**

- Plan – plan the process
- Initiate – start the process
- Execute – perform the process
- Close – end the process
- Reflect – analyze data
-
-
-
-
-

9 **Data Analysis**

- We can follow *affinity diagram* method

10 **Affinity Diagram Method (Recap)**

- FIVE steps
  1. Generate Idea
  2. Display ideas
  3. Sort ideas into groups

4. Create "group header"
5. Draw finished diagram

11 **Assumption**

- We performed CI
  - With few students - they used paper-based, desktop and mobile calendars for academic activities only
  - Observations made and noted down (sticky-notes)
  - Affinity diagram created for analysis

12 **Step 1 & 2 – Generate & Display Ideas**

13 **Step 3 – Grouping**

14 **Step 4 – Header**

15 **Step 4 – Header**

16 **Step 4 – Header (Another Way)**

17 **Step 5 – Finished Diagram**

18 **Note**

- The observations are for all types of calendars used in the study
- Same observations we can group in different ways
- Next lecture – what to do with this diagram!
